

# SmartForm STYLING

The perfect tool for high quality design

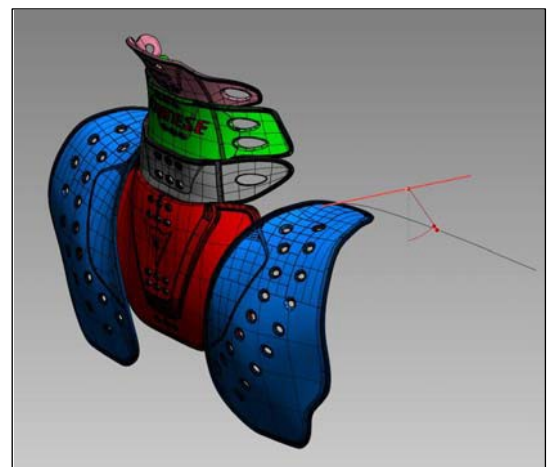

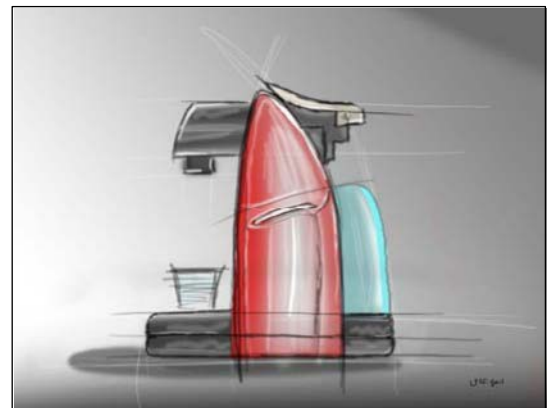

**SF Styling** offers an innovative approach to design. With its **Target Driven Design**, it frees users from the technological constraints of traditional design systems. With **SF Styling**, designers first **set targets**: points, curves or **even the exact highlight they want to get on an object**, then focus on the product shape, anyway they want, and transform the project into a model that includes all technical and engineering aspects while preserving the original design intent. It is possible to create a preview of every shape deriving from a modification made with **GSM (Global Shape Modeling)** and select the required one only. It enables higher creativity levels while increasing and enhancing design processes. In addition to traditional creation and modification functionalities, **SF Styling's** rich capabilities include powerful tools such as **Global Shape Modeling, Capping, Blending Curves** and **Blending Shapes**, associative **Global Sweep**, as well as dynamic morphing, **Automotive Grid** and **Rendering**.

## Image Importation

It is possible to **include in the work area 3D images in standard graphic formats from scanners or graphic processing applications**. These **images can be used as basic sketch to build the required shapes** or curves to realize the shape while preserving the designer's creative intent.

## GSM Global Shape Modeling and GSM Zone Modeling

**SmartForm Global Shape Modeling**, now called **GSM**, provides designers a very high level of technological innovation with unrivalled ease of use. It is **currently the only creation and modification tool that enables quick and accurate changes in any stage of the design process**, accelerating interactions with unlimited creativity and eliminating the need to rebuild models. This innovative **technology can also be applied locally to only certain areas of a model**, removing the limitations of traditional modeling programs. With the benefits of **Solid Modeling** and the flexibility of **free shaped surfacing tools**, it is possible to make extremely creative and **accurate changes to any kind of shape, both native and imported**, ensuring **full and faster associativity** compared to traditional approaches.

## Reflection Highlight

It eliminates the need to build and rebuild models. The user defines the required highlight on the object and **SmartForm's** technology automatically builds the shape. **This unique solution allows the modification a shape by changing the reflection light on the shape itself.**

## Rake Sweep

In the wider Touch & Design project context ([www.kaemart.it/touch-and-design](http://www.kaemart.it/touch-and-design)), which will allow users to work with a virtual rake on virtual clay, this control enables the creation of high quality surfaces that simulate the movement of the rake on the clay. It is a unique instrument for achieving high quality shapes simulating the clay modeling techniques typical of car industries.

## Adaptive Measures

Its powerful and intuitive measuring capabilities pull dimensional values from other components, eliminating the need of parallel calculations or the creation of reference spreadsheets, allowing greater creativity while saving time.

## Real Time Dynamic Rendering

It enables working on a model with an unrivalled level of realism. For example, by applying the **GSM** functionality to a rendered model it is possible to view the resulting change in real time. In addition, dynamic rendering enables the mapping of the surrounding environment in different modes, while textures can be applied to surfaces by means of various options.

## 2D/3D Transparency

**SF Styling** offers a single design environment with 2D/3D/PLM (**Product Lifecycle Management**) transparency, eliminating the need of expensive 2D/3D interfaces. **SF Styling's** best-in-class 2D and 3D environments ensure extremely high interoperability levels.

## 2D and 3D Translators

**SF Styling** features 2D translators for DWG, DXF, IGES and GBG Draftmaker formats, as well as 3D translators for IGES, STEP, STL, VDA, VRML, WaveFront and IV formats, the neutral format of **SmartFrom** and ASCII. Other **SF** translation platforms (purchased separately) support most of the proprietary 3D formats as well as the bidirectional conversion of Catia V5, Pro/E and Parasolid files. The bidirectional converter for Catia V4 files is also available (2D included).

## System Requirements for SmartForm Styling

### Minimum

- Vista™, XP Pro x64 Edition, XP Pro or higher  
Microsoft® Windows® -7 x64 Pro higher
- Intel® Core-i5 2.66 GHz or equivalent processors by AMD systems
- System memory (RAM) 2 GB, 8 GB for x64
- Virtual memory (paging) 1 GB
- Disk space 1.5 GB for a typical installation
- Graphics accelerator 1 GB Vram OpenGL™
- Microsoft® .NET Framework Version 3.5 or higher
- Microsoft® Internet Explorer 8.0 SP1 or higher

### Suggested

- Vista™, XP Pro x64 Edition, XP Pro or higher  
Microsoft® Windows® -7 x64 Pro or higher
- Intel® Core-i7 3.2 GHz or equivalent processors by AMD systems
- System memory (RAM) 2 GB, 16 GB for x64
- Virtual memory (paging) 2 GB
- Disk space 600 MB for a typical installation
- Graphics accelerator 2 GB Vram OpenGL™
- Microsoft® .NET Framework Version 3.5 or higher
- Microsoft® Internet Explorer 8.0 SP1 or higher
